Crankshaft Gear Puller

Prototype model shown as modeled from Russian OEM gear puller. Our new tool features very high tensile steel jaws with water jet cut profile. Radius profiled to gear circle tempered after machining - this puller considerably exceeds strength of the OEM puller jaws. Fit over gears has been deepened to provide adequate purchase. Equipped with free rotating button to prevent damage to crankshaft snout. Production version uses hex head driver screw so that a socket or box end wrench can be used to turn down the driver. Finished in black Anadol conversion coat (similar to gun bluing). This is a professional grade tool.

Pull your Gears - not your hair!
